**Background:** This gene encodes a member of von Willebrand factor A domain-containing protein family.

The proteins of this family are thought to be involved in the formation of filamentous

networks in the extracellular matrices of various tissues. This family member is thought to be play a role in reorganizing and regenerating the corneal matrix in granular and lattice type I dystrophies. It may also be involved in wound healing in the dentin-pulp complex. Alternative

splicing results in multiple transcript variants.
