	Melanophilin (MLPH) Rabbit Polyclonal Antibody – TA378570S
Background:	This gene encodes a member of the exophilin subfamily of Rab effector proteins. The protein forms a ternary complex with the small Ras-related GTPase Rab27A in its GTP-bound form and the motor protein myosin Va. A similar protein complex in mouse functions to tether pigment-producing organelles called melanosomes to the actin cytoskeleton in melanocytes, and is required for visible pigmentation in the hair and skin. A mutation in this gene results ir Griscelli syndrome type 3, which is characterized by a silver-gray hair color and abnormal pigment distribution in the hair shaft. Several alternatively spliced transcript variants encoding different isoforms have been found for this gene.

Synonyms: exophilin-3; l(1)-3Rk; l1Rk3; ln; melanophilin; MGC2771; MGC59733; Slac-2a; SlaC2-a; SLAC2A
