#### **GRIGENE** MRPL23 Rabbit Polyclonal Antibody – TA378646

Background:Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in<br/>protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)<br/>consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein<br/>to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.<br/>Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that<br/>the latter contain a 5S rRNA. Among different species, the proteins comprising the<br/>mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which<br/>prevents easy recognition by sequence homology. This gene encodes a 39S subunit protein.<br/>The gene is biallelically expressed, despite its location within a region of imprinted genes on<br/>chromosome 11.
