**Background:** Metalloprotease that specifically deubiquitinates monoubiquitinated histone H2A, a specific

tag for epigenetic transcriptional repression, thereby acting as a coactivator. Preferentially deubiquitinates monoubiquitinated H2A in hyperacetylated nucleosomes. Deubiquitination of histone H2A leads to facilitate the phosphorylation and dissociation of histone H1 from the nucleosome. Acts as a coactivator by participating in the initiation and elongation steps of

androgen receptor (AR)-induced gene activation.

**Synonyms:** 2A-DUB; 2ADUB; DKFZp779|1554; DKFZp779|1721; KIAA1915; RP4-592A1.1
