Q13469

Background: This gene is a member of the nuclear factor of activated T cells (NFAT) family. The product of

this gene is a DNA-binding protein with a REL-homology region (RHR) and an NFAT-homology region (NHR). This protein is present in the cytosol and only translocates to the nucleus upon T cell receptor (TCR) stimulation, where it becomes a member of the nuclear factors of activated T cells transcription complex. This complex plays a central role in inducing gene transcription during the immune response. Alternate transcriptional splice variants encoding

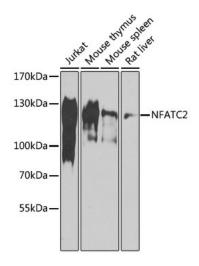

different isoforms have been characterized.

Synonyms: NF-ATP; NFAT1; NFATP
