PATZ1 Rabbit Polyclonal Antibody – TA379649S

Background:The protein encoded by this gene contains an A-T hook DNA binding motif which usually
binds to other DNA binding structures to play an important role in chromatin modeling and
transcription regulation. Its Poz domain is thought to function as a site for protein-protein
interaction and is required for transcriptional repression, and the zinc-fingers comprise the
DNA binding domain. Since the encoded protein has typical features of a transcription factor,
it is postulated to be a repressor of gene expression. In small round cell sarcoma, this gene is
fused to EWS by a small inversion of 22q, then the hybrid is thought to be translocated
(t(1;22)(p36.1;q12). The rearrangement of chromosome 22 involves intron 8 of EWS and exon
1 of this gene creating a chimeric sequence containing the transactivation domain of EWS
fused to zinc finger domain of this protein. This is a distinct example of an intra-
chromosomal rearrangement of chromosome 22. Four alternatively spliced transcript
variants are described for this gene.
