	PFKFB2 Rabbit Polyclonal Antibody – TA379829S
Background:	The protein encoded by this gene is involved in both the synthesis and degradation of fructose-2,6-bisphosphate, a regulatory molecule that controls glycolysis in eukaryotes. The encoded protein has a 6-phosphofructo-2-kinase activity that catalyzes the synthesis of fructose-2,6-bisphosphate, and a fructose-2,6-biphosphatase activity that catalyzes the degradation of fructose-2,6-bisphosphate. This protein regulates fructose-2,6-bisphosphate levels in the heart, while a related enzyme encoded by a different gene regulates fructose-2,6-bisphosphate levels in the liver and muscle. This enzyme functions as a homodimer. Two transcript variants encoding two different isoforms have been found for this gene.
Synonyms:	6-phosphofructo-2-kinase/fructose-2,6-biphosphatas; 6-phosphofructo-2-kinase/fructose-2,6- bisphosphata; DKFZp781D2217; MGC138308; MGC138310; PFK-2/FBPase-2
