Background: The protein encoded by this gene is a membrane-bound homodimeric enzyme that is

localized to the cisternae of the rough endoplasmic reticulum. The enzyme (cofactors iron and ascorbate) catalyzes the hydroxylation of lysyl residues in collagen-like peptides. The resultant hydroxylysyl groups are attachment sites for carbohydrates in collagen and thus are

critical for the stability of intermolecular crosslinks. Some patients with Ehlers-Danlos

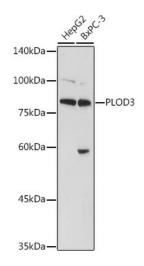

syndrome type VIB have deficiencies in lysyl hydroxylase activity.

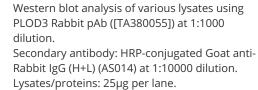

Synonyms: LH3
