| Background:             | This gene encodes a transmembrane proteolipid protein that is the predominant component<br>of myelin. The encoded protein may play a role in the compaction, stabilization, and<br>maintenance of myelin sheaths, as well as in oligodendrocyte development and axonal<br>survival. Mutations in this gene cause Pelizaeus-Merzbacher disease and spastic paraplegia<br>type 2. Alternatively splicing results in multiple transcript variants, including the DM20 splice<br>variant. |
| Synonyms:               | HLD1; lipophilin; MMPL; PLP; PLP/DM20; PMD; SPG2  |
