Background:	The protein encoded by this gene is a small glycoprotein involved in the catabolism of lipid- modified proteins during lysosomal degradation. The encoded enzyme removes thioester- linked fatty acyl groups such as palmitate from cysteine residues. Defects in this gene are a cause of infantile neuronal ceroid lipofuscinosis 1 (CLN1, or INCL) and neuronal ceroid lipofuscinosis 4 (CLN4). Two transcript variants encoding different isoforms have been found for this gene.
Synonyms:	CLN1; INCL; PPT; PPT-1
