Background: The DNA-associated protein encoded by this gene is a member of the paired family of

homeobox proteins. Expression is localized to proliferating fetal fibroblasts and the

developing dermal layer, with downregulated expression in adult skin. Increases in expression of this gene during fetal but not adult wound healing suggest a possible role in mechanisms that control mammalian dermal regeneration and prevent formation of scar response to wounding. The expression patterns provide evidence consistent with a role in fetal skin

development and a possible role in cellular proliferation.
