#### **PSMA4** Rabbit Polyclonal Antibody – TA380446S

Background:The proteasome is a multicatalytic proteinase complex with a highly ordered ring-shaped 20S<br/>core structure. The core structure is composed of 4 rings of 28 non-identical subunits; 2 rings<br/>are composed of 7 alpha subunits and 2 rings are composed of 7 beta subunits. Proteasomes<br/>are distributed throughout eukaryotic cells at a high concentration and cleave peptides in an<br/>ATP/ubiquitin-dependent process in a non-lysosomal pathway. An essential function of a<br/>modified proteasome, the immunoproteasome, is the processing of class I MHC peptides.<br/>This gene encodes a member of the peptidase T1A family, that is a 20S core alpha subunit.<br/>Three alternatively spliced transcript variants encoding different isoforms have been found<br/>for this gene.
