### **PTP epsilon (PTPRE) Rabbit Polyclonal Antibody – TA380545S**

Background:The protein encoded by this gene is a member of the protein tyrosine phosphatase (PTP)<br/>family. PTPs are known to be signaling molecules that regulate a variety of cellular processes<br/>including cell growth, differentiation, mitotic cycle, and oncogenic transformation. Several<br/>alternatively spliced transcript variants of this gene have been reported, at least two of which<br/>encode a receptor-type PTP that possesses a short extracellular domain, a single<br/>transmembrane region, and two tandem intracytoplasmic catalytic domains; another one<br/>encodes a PTP that contains a distinct hydrophilic N-terminus, and thus represents a<br/>nonreceptor-type isoform of this PTP. Studies of the similar gene in mice suggested the<br/>regulatory roles of this PTP in RAS related signal transduction pathways, cytokine-induced<br/>SATA signaling, as well as the activation of voltage-gated K+ channels.
