GRIGENE PTPRS Rabbit Polyclonal Antibody – TA380557

Background:The protein encoded by this gene is a member of the protein tyrosine phosphatase (PTP)
family. PTPs are known to be signaling molecules that regulate a variety of cellular processes
including cell growth, differentiation, mitotic cycle, and oncogenic transformation. This PTP
contains an extracellular region, a single transmembrane segment and two tandem
intracytoplasmic catalytic domains, and thus represents a receptor-type PTP. The
extracellular region of this protein is composed of multiple Ig-like and fibronectin type III-like
domains. Studies of the similar gene in mice suggested that this PTP may be involved in cell-
cell interaction, primary axonogenesis, and axon guidance during embryogenesis. This PTP
has been also implicated in the molecular control of adult nerve repair. Four alternatively
spliced transcript variants, which encode distinct proteins, have been reported.

Synonyms:

PTPSIGMA; R-PTP-S; R-PTP-sigma
