GRIGENE RAMP1 Rabbit Polyclonal Antibody – TA380695

Background:The protein encoded by this gene is a member of the RAMP family of single-transmembrane-
domain proteins, called receptor (calcitonin) activity modifying proteins (RAMPs). RAMPs are
type I transmembrane proteins with an extracellular N terminus and a cytoplasmic C
terminus. RAMPs are required to transport calcitonin-receptor-like receptor (CRLR) to the
plasma membrane. CRLR, a receptor with seven transmembrane domains, can function as
either a calcitonin-gene-related peptide (CGRP) receptor or an adrenomedullin receptor,
depending on which members of the RAMP family are expressed. In the presence of this
(RAMP1) protein, CRLR functions as a CGRP receptor. The RAMP1 protein is involved in the
terminal glycosylation, maturation, and presentation of the CGRP receptor to the cell surface.
Alternative splicing results in multiple transcript variants encoding different isoforms.
