Background: This gene encodes a transcriptional repressor that represses neuronal genes in non-neuronal

tissues. It is a member of the Kruppel-type zinc finger transcription factor family. It represses transcription by binding a DNA sequence element called the neuron-restrictive silencer element. The protein is also found in undifferentiated neuronal progenitor cells and it is

thought that this repressor may act as a master negative regular of neurogenesis.

Alternatively spliced transcript variants have been described

Synonyms: NRSF; XBR
