**Background:** This gene encodes a member of the regulatory factor X (RFX) family of transcription factors,

which are characterized by a winged-helix DNA-binding domain. The encoded transcription factor contains an N-terminal activation domain and a C-terminal repression domain, and

may activate or repress target gene expression depending on cellular context. This

transcription factor has been shown to regulate a wide variety of genes involved in immunity and cancer, including the MHC class II genes and genes that may be involved in cancer progression. This gene exhibits altered expression in glioblastoma and the autoimmune

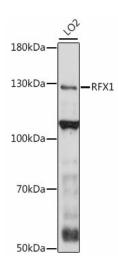

disease systemic lupus erythematosis (SLE).

**Synonyms:** EF-C; EFC; RFX
