#### **GRIGENE** RPL32 Rabbit Polyclonal Antibody – TA381057S

Background:Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and<br/>a large 60S subunit. Together these subunits are composed of 4 RNA species and<br/>approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is<br/>a component of the 60S subunit. The protein belongs to the L32E family of ribosomal<br/>proteins. It is located in the cytoplasm. Although some studies have mapped this gene to<br/>3q13.3-q21, it is believed to map to 3p25-p24. As is typical for genes encoding ribosomal<br/>proteins, there are multiple processed pseudogenes of this gene dispersed through the<br/>genome. Alternatively spliced transcript variants encoding the same protein have been<br/>observed for this gene.
