GRIGENE RPS5 Rabbit Polyclonal Antibody – TA381116S

RPS5

Background:Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and
a large 60S subunit. Together these subunits are composed of 4 RNA species and
approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is
a component of the 40S subunit. The protein belongs to the S7P family of ribosomal proteins.
It is located in the cytoplasm. Variable expression of this gene in colorectal cancers compared
to adjacent normal tissues has been observed, although no correlation between the level of
expression and the severity of the disease has been found. As is typical for genes encoding
ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed
through the genome.
