Background: The protein encoded by this gene is a transmembrane (type I) heparan sulfate proteoglycan

and is a member of the syndecan proteoglycan family. The syndecans mediate cell binding, cell signaling, and cytoskeletal organization and syndecan receptors are required for

internalization of the HIV-1 tat protein. The syndecan-2 protein functions as an integral membrane protein and participates in cell proliferation, cell migration and cell-matrix interactions via its receptor for extracellular matrix proteins. Altered syndecan-2 expression

has been detected in several different tumor types.

Synonyms: fibroglycan; HSPG; HSPG1; SYND2
