Q92629

**Background:** The protein encoded by this gene is one of the four known components of the sarcoglycan

complex, which is a subcomplex of the dystrophin-glycoprotein complex (DGC). DGC forms a link between the F-actin cytoskeleton and the extracellular matrix. This protein is expressed most abundantly in skeletal and cardiac muscle. Mutations in this gene have been associated with autosomal recessive limb-girdle muscular dystrophy and dilated cardiomyopathy. Alternatively spliced transcript variants encoding distinct isoforms have been observed for

this gene.

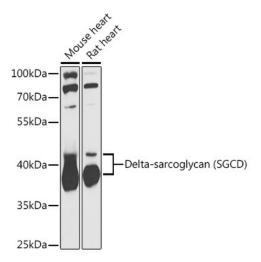

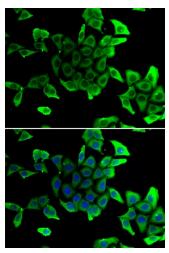

Synonyms:

35DAG; CMD1L; DAGD; delta-sarcoglycan; LGMD2F; MGC22567; SG-delta; SGCDP; SGD
