Background: This gene encodes a member of the sialic acid-binding immunoglobulin-like lectin (Siglec)

family. These cell surface lectins are characterized by structural motifs in the immunoglobulin (lg)-like domains and sialic acid recognition sites in the first lg V set domain. The encoded protein is a member of the CD33-related subset of Siglecs and inhibits the activation of several cell types including monocytes, macrophages and neutrophils. Binding of group B

Streptococcus (GBS) to the encoded protein plays a role in GBS immune evasion.

Synonyms: CD33L2; CD170; OB-BP2; OBBP2; SIGLEC-5
