Background: Polyspecific organic cation transporters in the liver, kidney, intestine, and other organs are

critical for elimination of many endogenous small organic cations as well as a wide array of drugs and environmental toxins. This gene is one of three similar cation transporter genes located in a cluster on chromosome 6. The encoded protein contains twelve putative

transmembrane domains and is a plasma integral membrane protein. It is found primarily in

the kidney, where it may mediate the first step in cation reabsorption.

Synonyms: hOCT2; MGC32628; OCT2
