Background: The protein encoded by this gene is a member of the SWI/SNF family of proteins, whose

members display helicase and ATPase activities and which are thought to regulate

transcription of certain genes by altering the chromatin structure around those genes. The encoded protein is part of the large ATP-dependent chromatin remodeling complex SNF/SWI

and contains a predicted leucine zipper motif typical of many transcription factors.

Alternatively spliced transcript variants encoding different isoforms have been found for this

gene.

Synonyms: BAF170; CRACC2; Rsc8
