Background: The protein encoded by this gene is involved in mRNA splicing and may play a role in the

determination of alternative splicing. The encoded nuclear protein belongs to the splicing factor SR family and has been shown to bind with and modulate another member of the family, SFRS12. Alternative splicing results in multiple transcript variants. In addition, two pseudogenes, one on chromosome 17 and the other on the X chromosome, have been found

for this gene.

Synonyms: B52; SFRS6; SRP55
