Background: This gene encodes a protein that is a member of the syntaxin or t-SNARE (target-SNAP

receptor) family. These proteins are found on cell membranes and serve as the targets for V-SNARES (vesicle-SNAP receptors) permitting specific synaptic vesicle docking and fusion. A

microdeletion in the region of chromosome 20 where this gene is located has been

associated with pseudohypoparathyroidism type lb. Multiple transcript variants have been found for this gene. Read-through transcription also exists between this gene and the

neighboring downstream aminopeptidase-like 1 (NPEPL1) gene.
