Background: Sulfotransferase enzymes catalyze the sulfate conjugation of many hormones,

neurotransmitters, drugs, and xenobiotic compounds. These cytosolic enzymes are different

in their tissue distributions and substrate specificities. The gene structure (number and

length of exons) is similar among family members. This gene sulfates

dehydroepiandrosterone but not 4-nitrophenol, a typical substrate for the phenol and estrogen sulfotransferase subfamilies. Two alternatively spliced variants that encode

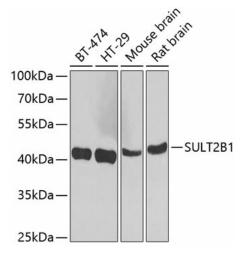

different isoforms have been described.

Synonyms: HSST2
