Background: This gene encodes a growth factor that is a ligand for the epidermal growth factor receptor,

which activates a signaling pathway for cell proliferation, differentiation and development. This protein may act as either a transmembrane-bound ligand or a soluble ligand. This gene has been associated with many types of cancers, and it may also be involved in some cases of cleft lip/palate. Alternatively spliced transcript variants encoding different isoforms have been

found for this gene.

Synonyms: TFGA
