#### **GRIGENE** UGT1A10 Rabbit Polyclonal Antibody – TA383074S

Background:This gene encodes a UDP-glucuronosyltransferase, an enzyme of the glucuronidation<br/>pathway that transforms small lipophilic molecules, such as steroids, bilirubin, hormones,<br/>and drugs, into water-soluble, excretable metabolites. This gene is part of a complex locus<br/>that encodes several UDP-glucuronosyltransferases. The locus includes thirteen unique<br/>alternate first exons followed by four common exons. Four of the alternate first exons are<br/>considered pseudogenes. Each of the remaining nine 5' exons may be spliced to the four<br/>common exons, resulting in nine proteins with different N-termini and identical C-termini.<br/>Each first exon encodes the substrate binding site, and is regulated by its own promoter. The<br/>enzyme encoded by this gene has glucuronidase activity on mycophenolic acid, coumarins,<br/>and quinolines.
