Background: Protein ubiquitination controls many intracellular processes, including cell cycle progression,

transcriptional activation, and signal transduction. This dynamic process, involving ubiquitin

conjugating enzymes and deubiquitinating enzymes, adds and removes ubiquitin.

Deubiquitinating enzymes are cysteine proteases that specifically cleave ubiquitin from

ubiquitin-conjugated protein substrates. This gene encodes a deubiquitinating enzyme which

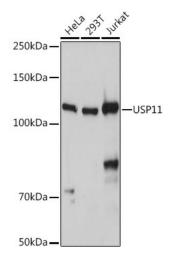

lies in a gene cluster on chromosome Xp11.23

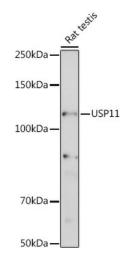

Synonyms: UHX1
