GRIGENE YTHDF2 Rabbit Polyclonal Antibody – TA383419

Background:This gene encodes a member of the YTH (YT521-B homology) superfamily containing YTH
domain. The YTH domain is typical for the eukaryotes and is particularly abundant in plants.
The YTH domain is usually located in the middle of the protein sequence and may function in
binding to RNA. In addition to a YTH domain, this protein has a proline rich region which may
be involved in signal transduction. An Alu-rich domain has been identified in one of the
introns of this gene, which is thought to be associated with human longevity. In addition,
reciprocal translocations between this gene and the Runx1 (AML1) gene on chromosome 21
has been observed in patients with acute myeloid leukemia. This gene was initially mapped to
chromosome 14, which was later turned out to be a pseudogene. Alternatively spliced
transcript variants encoding different isoforms have been identified in this gene.
