GRIGENE ZFX Rabbit Polyclonal Antibody – TA383487S

Background:This gene on the X chromosome is structurally similar to a related gene on the Y
chromosome. It encodes a member of the krueppel C2H2-type zinc-finger protein family. The
full-length protein contains an acidic transcriptional activation domain (AD), a nuclear
localization sequence (NLS) and a DNA binding domain (DBD) consisting of 13 C2H2-type zinc
fingers. Studies in mouse embryonic and adult hematopoietic stem cells showed that this
gene was required as a transcriptional regulator for self-renewal of both stem cell types, but
it was dispensable for growth and differentiation of their progeny. Multiple alternatively
spliced transcript variants encoding different isoforms have been identified, but the full-
length nature of some variants has not been determined.
