| Background:             | This gene encodes a member of the ZIC family of C2H2-type zinc finger proteins. This protein<br>functions as a transcriptional repressor and may regulate tissue specific expression of<br>dopamine receptor D1. Expansion of an alanine repeat in the C-terminus of the encoded<br>protein and other mutations in this gene cause holoprosencephaly type 5.<br>Holoprosencephaly is the most common structural anomaly of the human brain. A<br>polyhistidine tract polymorphism in this gene may be associated with increased risk of neural<br>tube defects. This gene is closely linked to a gene encoding zinc finger protein of the<br>cerebellum 5, a related family member on chromosome 13. |
