#### **GRIGENE** ZNF384 Rabbit Polyclonal Antibody – TA383557S

Background:This gene encodes a C2H2-type zinc finger protein, which may function as a transcription<br/>factor. This gene also contains long CAG trinucleotide repeats that encode consecutive<br/>glutamine residues. The protein appears to bind and regulate the promoters of the<br/>extracellular matrix genes MMP1, MMP3, MMP7 and COL1A1. Studies in mouse suggest that<br/>nuclear matrix transcription factors (NP/NMP4) may be part of a general mechanical pathway<br/>that couples cell construction and function during extracellular matrix remodeling. Alternative<br/>splicing results in multiple transcript variants. Recurrent rearrangements of this gene with the<br/>Ewing's sarcoma gene, EWSR1 on chromosome 22, or with the TAF15 gene on chromosome<br/>17, or with the TCF3 (E2A) gene on chromosome 19, have been observed in acute leukemia. A<br/>related pseudogene has been identified on chromosome 7.

Synonyms:

CAGH1; CAGH1A; CIZ; ERDA2; FLJ59043; NMP4; NP; TNRC1
