Background:	Swiss-Prot Acc.P01834.The five types of immunoglobulin heavy chains are known as: lgG, lgA, lgM, lgD, and lgE. lgG is divided into four subclasses, and lgA is divided into two subclasses. In serum lgA and lgG are monomers with a single 4 polypeptide unit; while, lgM is a pen tamer. lgA may also form polymers. Kappa light chain antibody can be used for the identification of leukemias, plasmacytomas and certain non Hodgkin's lymphomas.
