| Background:           | Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin,<br>limiting DNA accessibility to the cellular machineries which require DNA as a template.<br>Histones thereby play a central role in transcription regulation, DNA repair, DNA replication<br>and chromosomal stability. DNA accessibility is regulated via a complex set of post-<br>translational modifications of histones, also called histone code, and nucleosome remodeling. |

#### **Product images:**

IHC image of TA387555 diluted at 1:50 and staining in paraffin-embedded human liver cancer performed on a Leica BondTM system. After dewaxing and hydration, antigen retrieval was mediated by high pressure in a citrate buffer (pH 6.0). Section was blocked with 10% normal goat serum 30min at RT. Then primary antibody (1% BSA) was incubated at 4°C overnight. The primary is detected by a biotinylated secondary antibody and visualized using an HRP conjugated SP system.

Western Blot Positive WB detected in: 293 whole cell lysate All lanes: HIST1H2AG antibody at 0.76µg/ml Secondary Goat polyclonal to rabbit IgG at 1/50000 dilution Predicted band size: 15 kDa Observed band size: 15 kDa
