| Background: | 60S ribosomal protein L27 is a protein that in humans is encoded by the RPL27 gene.Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60S subunit. The protein belongs to the L27E family of ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed through the genome. |
