GRIGENE MEK1 (MAP2K1) Rabbit Polyclonal Antibody – TA392531

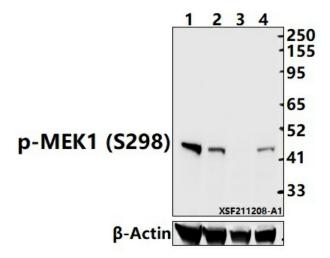

Background:MEK1 (Mitogen activated protein kinase kinase 1) catalyzes the concomitant phosphorylation
of a threonine and a tyrosine residue in a Thr-Glu-Tyr sequence located in MAP kinases.
MEK1 activates ERK1 and ERK2 MAP kinases. Mitogen activated protein kinase kinase 2 (MEK2
or MAPKK2) is a member of a family of tyrosine/threonine protein kinases that activate the
ERK1 and 2 and MAPK enzymes by phosphorylating both residues within the
threonine/glutamate/tyrosine (TEY) motif in the activation loop. MEK1 and 2 are also
activated by dual phosphorylation, which occurs on serine 218 and 222, in the activation loop
of the MEK. Threonine 292 of MEK1 is phosphorylated by ERK 2, which serves as a negative
feedback loop by suppressing activation of MEK1.

Synonyms:Dual specificity mitogen-activated protein kinase kinase 1; ERK activator kinase 1; MAP2K1;MAPK/ERK kinase 1; MAP kinase kinase 1; MAPKK 1; MEK-1; MEK 1; MKK1; PRKMK1
