Background:	Androgen receptor (AR), a zinc finger transcription factor belonging to the nuclear receptor superfamily, is activated by phosphorylation and dimerization upon ligand binding. This promotes nuclear localization and binding of AR to androgen response elements in androgen target genes. Research studies have shown that AR plays a crucial role in several stages of male development and the progression of prostate cancer.
Synonyms:	Androgen receptor; AR; DHTR; Dihydrotestosterone receptor; NR3C4; Nuclear receptor subfamily 3 group C member 4
Note:	For research use only, not for use in diagnostic procedure.
