| Background: | Hepatocyte nuclear factor 4α (HNF4 α) is a transcription factor that belongs to the steroid hormone receptor superfamily and is enriched in liver. HNF4 α , in association with PGC-1 α , activates gluconeogenic genes such as phosphoenolpyruvate carboxykinase and glucose-6- phosphatase genes in fasted livers. Conditional knockout of the HNF4 α gene in the mouse liver destroys lipid homeostasis and leads to lipid accumulation in the liver and a reduction of serum cholesterol and triglyceride levels. Mutations in HNF4 α have been linked to maturity- onset diabetes of the young (MODY). |
| Synonyms: | Hepatocyte nuclear factor 4-alpha; HNF-4-alpha; Nuclear receptor subfamily 2 group A member 1; TCF-14; Transcription factor 14; Transcription factor HNF-4 |
