**Background:** ATP5H (ATP synthase, H+ transporting, mitochondrial Fo complex, subunit  $\delta$ ), also known as

ATPQ, is a 161 amino acid protein that belongs to the ATPase  $\delta$  subunit family. F-type

ATPases, such as ATP5H, consist of two linked components: CF1, a soluble catalytic core that consists of five different subunits ( $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$  and  $\epsilon$ ), and CF0, a membrane proton channel that contains nine subunits ( $\alpha$ ,  $\beta$ ,  $\chi$ ,  $\delta$ ,  $\epsilon$ ,  $\phi$ ,  $\gamma$ , F6 and 8). ATP5H encodes the  $\delta$  subunit of the F0 complex. ATP5H produces ATP from ADP in the presence of a proton gradient across the membrane, which is generated by electron transport complexes of the respiratory chain.

Localizing to mitochondrial inner membrane,
