Background:	Calcium-binding chaperone that promotes folding, oligomeric assembly and quality control in the endoplasmic reticulum (ER) via the calreticulin/calnexin cycle. This lectin interacts transiently with almost all of the monoglucosylated glycoproteins that are synthesized in the ER. Interacts with the DNA-binding domain of NR3C1 and mediates its nuclear export. Involved in maternal gene expression regulation. May participate in oocyte maturation via the regulation of calcium homeostasis
Synonyms:	CALR; Calregulin; Calreticulin; CRP55; CRTC; Endoplasmic reticulum resident protein 60; ERp60; grp60; HACBP
Note:	For research use only, not for use in diagnostic procedure.
