GRIGENE RPS9 Rabbit Polyclonal Antibody – TA392825

Background:Ribosomes, the organelles that catalyze protein synthesis, are composed of a small subunit
(40S) and a large subunit (60S) that consist of over 80 distinct ribosomal proteins. Mammalian
ribosomal proteins are encoded by multigene families that contain processed pseudogenes
and one functional intron-containing gene within their coding regions. Ribosomal Protein L27,
also known as RPL27, is a 136 amino acid protein belonging to the ribosomal protein L27e
family exists as a component of the 60S subunit, possibly playing a role in protein translation.
Like most ribosomal proteins, Ribosomal Protein L27 exists as multiple processed
pseudogenes that are scattered throughout the genome. Considered a novel candidate
housekeeping gene, the gene encoding Ribosomal Protein L27 maps to human chromosome
17, which comprises over 2.5% of the human genome and encodes over 1,200 genes.
