Background:	The integrin family contains at least 18 α and 8 β subunits that form 24 known integrins with distinct tissue distribution and overlaping ligand specificities. Integrins not only transmit signals to cells in response to the extracellular environment (outside-in signaling), but also sense intracellular cues to alter their interaction with extracellular environment (inside-out signaling). Several α V subfamily members, including α V β 3, α V β 5, α V β 1, are highly expressed in active endothelial cells and cancer cells where they play a critical role in angiogenesis and tumor metastasis.
Synonyms:	CD51; Integrin alpha-V; Integrin alpha-V heavy chain; Integrin alpha-V light chain; ITGAV; MSK8; Vitronectin receptor subunit alpha; VNRA
