Background: Cell adhesion molecules are a family of closely related cell surface glycoproteins involved in

cell-cell interactions during growth and are thought to play an important role in

embryogenesis and development. VCAM-1 (vascular cell adhesion molecule-1) was first identified as an adhesion molecule induced on human endothelial cells by inflammatory cytokines such as IL-1, tumor necrosis factor (TNF) and lipopolysaccharide (LPS). The KALIG gene encodes a nerve cell adhesion molecule (NCAM) -like protein and is deleted in 66% of

patients with Kallmann's syndrome, anosmia with secondary hypogonadism

Synonyms: CD106; INCAM-100; L1CAM; V-CAM 1; Vascular cell adhesion protein 1; VCAM-1
