Background: The protein encoded by this gene is a member of the AKT, also called PKB, serine/threonine

protein kinase family. AKT kinases are known to be regulators of cell signaling in response to

insulin and growth factors. They are involved in a wide variety of biological processes including cell proliferation, differentiation, apoptosis, tumorigenesis, as well as glycogen synthesis and glucose uptake. This kinase has been shown to be stimulated by platelet-derived growth factor (PDGF), insulin, and insulin-like growth factor 1 (IGF1). Alternatively

splice transcript variants encoding distinct isoforms have been described.

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY AKT3 (Cat# [RC221051], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-AKT3 (Cat# [TA500001]).
