**Background:** This gene encodes one of the major intermediate filament proteins of mature astrocytes. It is

used as a marker to distinguish astrocytes from other glial cells during development.

Mutations in this gene cause Alexander disease, a rare disorder of astrocytes in the central nervous system. Alternative splicing results in multiple transcript variants encoding distinct

isoforms.

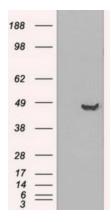

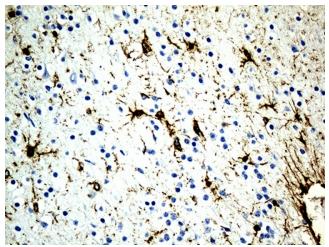

Synonyms: ALXDRD

Protein Families: ES Cell Differentiation/IPS

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY GFAP ([RC204548], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-GFAP. Positive lysates [LY419563] (100ug) and [LC419563] (20ug) can be purchased separately from OriGene.
