Background: The protein encoded by this gene binds copper and zinc ions and is one of two isozymes responsible for destroying free superoxide radicals in the body. The encoded isozyme is a soluble cytoplasmic protein, acting as a homodimer to convert naturally-occurring but harmful superoxide radicals to molecular oxygen and hydrogen peroxide. The other isozyme is a mitochondrial protein. Mutations in this gene have been implicated as causes of familial amyotrophic lateral sclerosis. Rare transcript variants have been reported for this gene. [provided by RefSeq]

Protein Families: Druggable Genome
Protein Pathways: Amyotrophic lateral sclerosis (ALS), Huntington's disease, Prion diseases

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY SOD1 (RC200725, Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-SOD1. Positive lysates LY400160 (100ug) and LC400160 (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 6 different cell lines by using anti-SOD1 monoclonal antibody (HepG2: human; HeLa: human; HT29: human; SVT2: mouse; A549: human; MCF7: human).
