Background:	Interferons are cytokines that have antiviral effects and inhibit tumor cell proliferation. They induce a large number of genes in their target cells, including those coding for the guanylate- binding proteins (GBPs). GBPs are characterized by their ability to specifically bind guanine nucleotides (GMP, GDP, and GTP). The protein encoded by this gene is a GTPase that converts GTP to GDP and GMP
Synonyms:	DKFZp451C2311

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY GBP2 ([RC209939], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-GBP2. Positive lysates [LY401329] (100ug) and [LC401329] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (10ug) from 6 different cell lines by using anti-GBP2 monoclonal antibody at 1:200 dilution.
