CRIGENE LOX Mouse Monoclonal Antibody (Biotin conjugated) [Clone ID: OTI6B7] – TA500869AM

Background:The protein encoded by this gene is an extracellular copper enzyme that initiates the
crosslinking of collagens and elastin. The enzyme catalyzes oxidative deamination of the
epsilon-amino group in certain lysine and hydroxylysine residues of collagens and lysine
residues of elastin. In addition to crosslinking extracellular matrix proteins, the encoded
protein may have a role in tumor suppression. Defects in this gene are a cause of autosomal
recessive cutis laxa type I (CL type I). Two transcript variants encoding different isoforms have
been found for this gene. [provided by RefSeq]

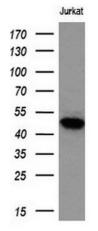

Synonyms: MGC105112

Protein Families: Druggable Genome, Secreted Protein

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY LOX ([RC213323], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-LOX. Positive lysates [LY400843] (100ug) and [LC400843] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (10ug) from 1 cell line by using anti-LOX monoclonal antibody (1:200).
